

Brilliant Chemist Gives up Dream of Curing Cancer, Focuses Efforts on Inducing 3 ½ Hour Erection

CAMBRIDGE, MA - Citing practical reasons, 41-year-old renowned chemist and laboratory researcher Charles Kenzington, Ph.D. has formally ended his three-decade quest to discover a compound to destroy all [malignant](#) cells.

The decorated scientist instead plans to concentrate on finding a drug to produce a prolific and lasting erection. Dr. Kenzington sat down with [Gomerblog](#) last week for an interview.

“Let’s be honest, curing a single form of cancer is quite difficult. It was a lofty and probably unrealistic goal when, at age 12, I vowed to myself that I would eradicate cancer from the Earth. I worked tirelessly in the classroom and lab and I made some crucial advances, but it isn’t feasible anymore. Plus, there’s not nearly as much [money](#) in cancer as there is in making erectile dysfunction drugs.”

“With cancer, the patient either ends up cured or dead, and either way they are no longer a customer. These days, the money is in treating symptoms, not diseases. If I can create a compound that consistently produces a 3 hour, but no longer than 4-hour [erection](#), I will have found the holy grail of American clinical pharmacology.”
